

Decoding Market Movements: PCA-Enhanced Machine Learning for S&P 500 Log Return Prediction

Student Name : Katherine Liu, Jeffrey Liu

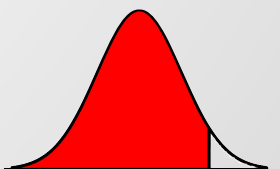

Advisor Name : Hui Wen Teng

National Yang Ming Chiao Tung University

[Project Github](#)

Outline

1. Introduction
2. Data
3. Methodology

Motivation

- ▣ Importance of S&P500 index
 - ▶ Benchmark for U.S. financial market
 - ▶ Influence on trading and portfolio strategy
 - ▶ Key role in risk management
- ▣ Characteristic of stock market
 - ▶ Dynamic
 - ▶ Nonlinear
 - ▶ Chaotic

Motivation

- ▣ Why PCA is useful
 - ▶ High-dimensional, correlated variables
 - ▶ Noise reduction, prevent overfitting
 - ▶ Dimensionality reduction → principal components
 - ▶ Latent factors extraction
 - ▶ Improved stability & interpretability

Research Objective

- ▣ Previous work
 - ▶ PCA on ANN / DL
- ▣ Gap
 - ▶ Lack PCA on SVM / RF
- ▣ Objective
 - ▶ Evaluate PCA on SVM / RF for log return prediction
 - ▶ Resource efficient

Data overview

- ▣ Source
 - ▶ Kaggle S&P 500 Volatility Prediction Time Series Data
- ▣ Time range
 - ▶ 2010/07/08 to 2019/10/04
- ▣ Variable types
 - ▶ Index-related variables
 - ▶ Options market variables
 - ▶ Macroeconomic and financial indicators
 - ▶ Market sentiment variables

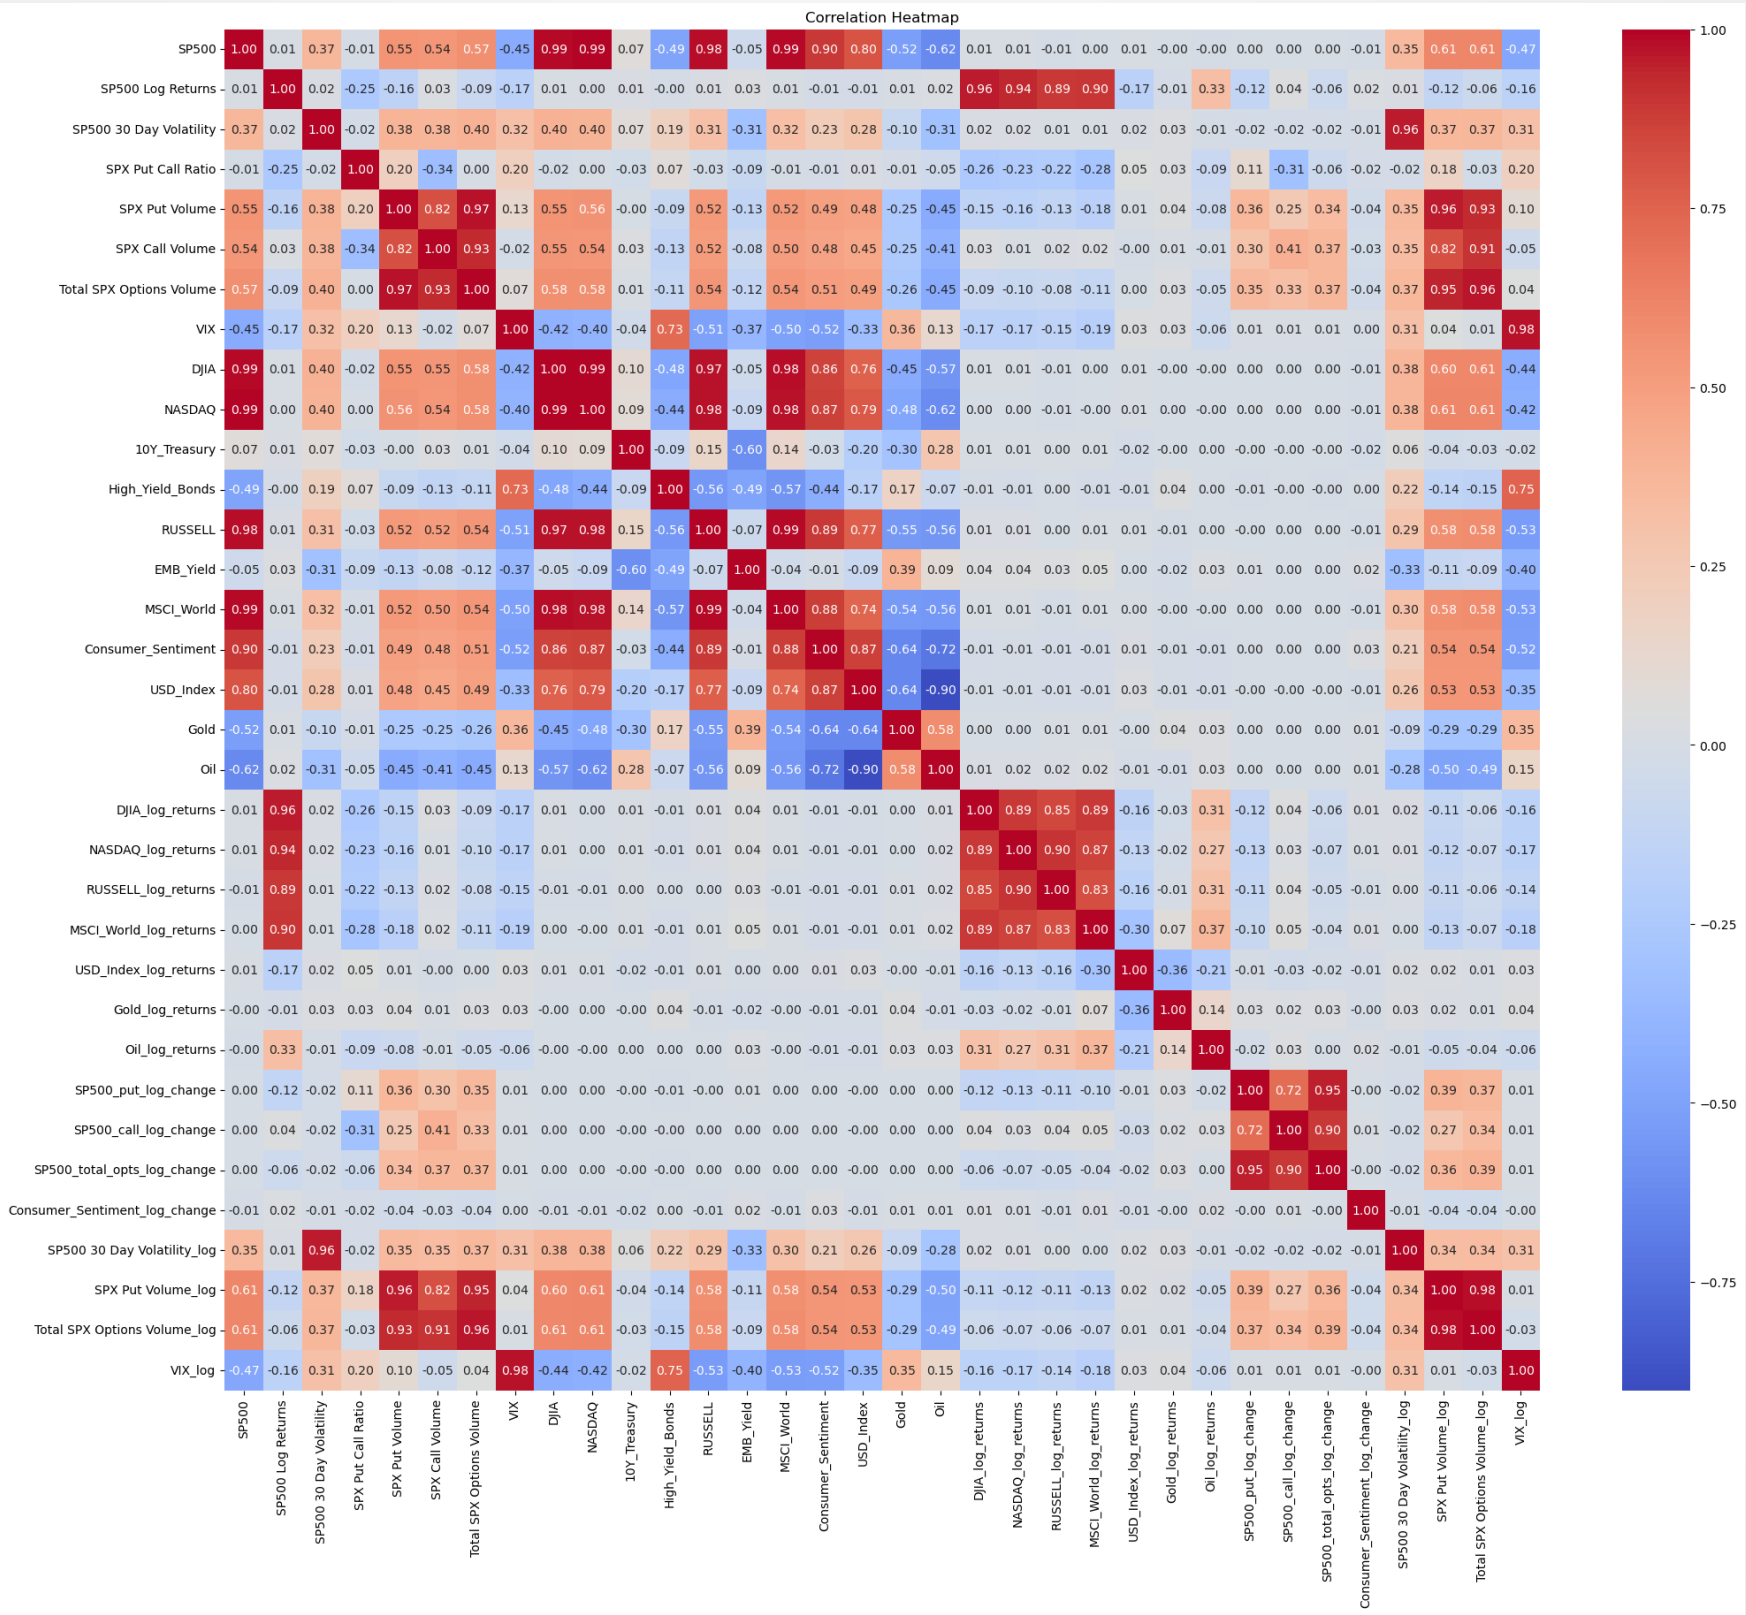

Data summary

	summary_statistics					
	mean	std	min	max	skewness	kurtosis
SP500	1978.67912	550.72266	1047.22000	3025.86000	0.14860	-1.10826

Heatmap

Benchmark model

- ▣ Linear regression model
- ▣ 70% for training 30% for testing
- ▣ Formula

$$y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \beta_3 x_3$$

$$y = S \ \& \ P500_daily_log_returns$$

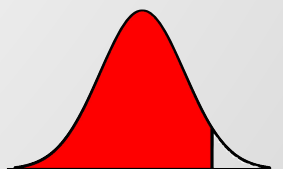

$$x_1 = SPX_Put - Call_Ratio$$

$$x_2 = DJIA_log_returns$$

$$x_3 = Oil_log_returns$$

$$\beta_0 = -0.00464, \quad \beta_1 = -0.00349, \quad \beta_2 = 0.93396, \quad \beta_3 = 0.02745$$

$$R^2 = 0.9148, \quad MSE = 0.0876, \quad MAE = 0.2033$$
